

Import Data using Transform Maps (Spreadsheet)

Phase 1 – Brainstorming & Ideation

Introduction

The Brainstorming and Ideation Phase is the starting point of the project. The project idea is based on importing structured spreadsheet data into ServiceNow and transforming it into useful records. Manual data entry can take more time and may create typing mistakes. Therefore, the idea is to use an Import Set and Transform Map to move spreadsheet data into the required ServiceNow table in a controlled way.

Problem Identification

Organizations often receive information in spreadsheet format. Entering every row manually into a ServiceNow table is repetitive and may cause missing values, duplicate records, incorrect field values, or inconsistent formats. A systematic import process can reduce repeated work and provide a clear method for mapping source fields to target fields.

Idea Generation

The main idea is to prepare a spreadsheet, import it into ServiceNow, create an Import Set, configure a Transform Map, map source fields to target fields, run the transformation, and verify the resulting records. This approach demonstrates an important ServiceNow data-management process.

Proposed Solution

The proposed solution uses spreadsheet data as the source and a ServiceNow table as the target. The Import Set temporarily receives the imported rows. The Transform Map defines how the source columns correspond to target fields. After transformation, the target table contains records in the expected structure.

Objectives

- • Reduce repetitive manual data entry.
- Demonstrate spreadsheet-to-ServiceNow data import.
- Understand Import Sets and Transform Maps.
- Perform source-to-target field mapping.
- Validate imported records after transformation.
- Maintain a documented and repeatable workflow.

Scope

The project focuses on spreadsheet-based data import using ServiceNow Transform Maps. It covers preparing source data, importing the spreadsheet, mapping fields, transforming records, checking results, and documenting the process. It can later be extended to scheduled imports, data cleansing, coalesce fields, and larger datasets.

Feasibility

The idea is feasible because it uses standard ServiceNow data-import capabilities. A spreadsheet can be prepared with clearly named columns, while the platform provides Import Sets and Transform Maps for controlled transformation. The project is also suitable for demonstrating a complete technical workflow.

Expected Outcome

At the end of this phase, the project should have a clear problem statement, practical solution idea, defined scope, and understandable workflow. The idea should be ready to move into Requirement Analysis, where exact functional and non-functional requirements will be identified.
