

Import Data using Transform Maps (Spreadsheet)

Phase 6 – Project Testing

Introduction

Project Testing verifies that the spreadsheet import and Transform Map work as intended. Testing is important because a workflow may execute successfully while still producing incorrect field values. Testing therefore checks both execution and data accuracy.

Testing Strategy

Testing should use a controlled sample spreadsheet containing known values. Each important field should be checked after transformation. The tester should compare original source values with values displayed in target records.

Positive Testing

Positive testing uses valid spreadsheet data. The expected result is that import completes successfully and target records contain correct mapped values. Multiple valid rows should be tested to confirm consistent behavior.

Field Mapping Testing

Each field mapping should be checked individually. If the source contains a name, email, identifier, or other value, the corresponding target field should display the expected information. Mapping errors should be corrected and the transformation tested again.

Negative Testing

Negative testing uses incorrect or incomplete data, such as missing required values, invalid formats, or unexpected entries. The purpose is to understand how the import and transformation respond to problematic records.

Error Testing

Transformation results should be reviewed for errors or rejected rows. Common causes include missing target fields, incorrect formats, required fields without values, or mapping mistakes. Each issue should be recorded along with its correction.

Test Documentation

A test table can contain Test Case ID, Input Condition, Expected Result, Actual Result, and Status. This provides evidence that the project was tested systematically. Screenshots may also be added where useful.

Testing Outcome

Testing is complete when valid data is transformed correctly, important mappings are verified, known invalid cases are understood, and identified issues are corrected or documented. The tested system can then move to final documentation and demonstration.
