

Import Data using Transform Maps (Spreadsheet)

Phase 7 – Project Documentation

Introduction

Project Documentation records the complete development process in a structured form. It allows another person to understand the project idea, requirements, design, configuration, testing, and final workflow without depending only on a live demonstration.

Project Overview

The project demonstrates how spreadsheet data can be imported into ServiceNow and transformed into records using Transform Maps. Documentation should begin with project title, objective, problem statement, proposed solution, scope, and expected outcome.

Configuration Documentation

The configuration section should describe the source spreadsheet, Import Set process, source table, target table, Transform Map, and field mappings. Exact names used in the ServiceNow environment should be recorded accurately when live configuration details are available.

Mapping Documentation

Field mapping documentation should show which source columns are connected to which target fields. This can be presented as a simple table. Mapping notes should explain any special handling, validation, or transformation logic.

Testing Documentation

Testing documentation should contain test strategy, sample inputs, expected results, actual results, and final status. Problems found during testing and corrections applied should also be documented.

GitHub Organization

For submission, the eight phase documents can be stored as separate PDF files inside one folder named Project Phases. Clear names such as 01_Brainstorming_and_Ideation.pdf make the repository easy to navigate and review.

Maintenance and Future Reference

Good documentation helps when the project needs to be repeated or extended. Future improvements may include scheduled spreadsheet imports, stronger validation, duplicate checking, additional transformation rules, and support for larger datasets.

Documentation Outcome

The final documentation should provide a complete and professional record of the project. It should be understandable, organized, and consistent with actual configuration and testing. This documentation also supports the final demonstration.
