

Import Data using Transform Maps (Spreadsheet)

Phase 8 – Project Demonstration

Introduction

The Project Demonstration Phase presents the completed spreadsheet import workflow to a reviewer. The demonstration should explain the project purpose first and then show the workflow in a logical order. A clear sequence helps the reviewer understand what happens to data at each stage.

Demonstration Introduction

The presentation can begin with the project title, objective, and problem statement. The student can explain that the project demonstrates importing spreadsheet data into ServiceNow and using a Transform Map to connect source fields with target fields.

Workflow Explanation

The workflow can be explained as: prepare spreadsheet → import source data → review Import Set → configure or select Transform Map → map fields → run transformation → verify target records. Each step should be explained briefly before moving to the next.

Import Set Demonstration

The Import Set stage demonstrates that spreadsheet data has entered ServiceNow. The reviewer can be shown imported columns and sample rows. This confirms that source data has been received before transformation.

Transform Map Demonstration

The Transform Map stage is the key part of the demonstration. The student can show selected source and target tables and explain field mappings. The explanation should focus on how each source value reaches the appropriate target field.

Result Demonstration

After transformation runs, the target table should be opened and sample records checked. The student can compare source values with target values to demonstrate that the mapping worked as expected.

Questions and Answers

Possible questions include: What is an Import Set? What is a Transform Map? Why is field mapping required? What happens when source data is incorrect? How are imported records verified? The student should answer using the project workflow and documented testing results.

Final Outcome

The demonstration should conclude by summarizing the problem, solution, workflow, testing, and result. The final submission should include the eight phase PDFs in one Project Phases folder so the complete project journey is available for review.
